

Release Notes

New Features

Provides five Measurement Plugins for Instrument Studio

- Automotive Vision Capture Plugin
- Automotive Ethernet Bus Capture Plugin
- CAN/LIN Frame Generator Plugin
- CAN/LIN Raw Bus Capture Plugin
- I2C Bus Monitor Plugin

Please see documentation [link](#) to access the index to each plugin README.

Dependencies

- InstrumentStudio 2025 Q3 or later
- LabVIEW 2025 Q4 or later
- Measurement Plugin SDK 3.5.0.2
- See individual measurement README's for NI driver version support.

Known Issues:

These issues are organized by plugin:

Auto Ethernet plugin

An extended duration pause (Such as 10K messages collecting) could cause a temporary slowdown when the plugin is unpaused as messages are flushed to the UI for a second or two.

The string filter activates when the user clicks away from the text field. There is no indicator that the string filter is processing and may take a second to apply. The standard ethernet mode is not yet implemented.

If the same system that displays the bus monitor is sending the messages at a rate of 1ms or faster, the UI can lag behind when there is a large buffer after an extended pause, causing the pause button to not take affect until the UI catches up.
